

El citoesqueleto

Parte I

Flavio Zolessi

¿Autoevaluaciones?

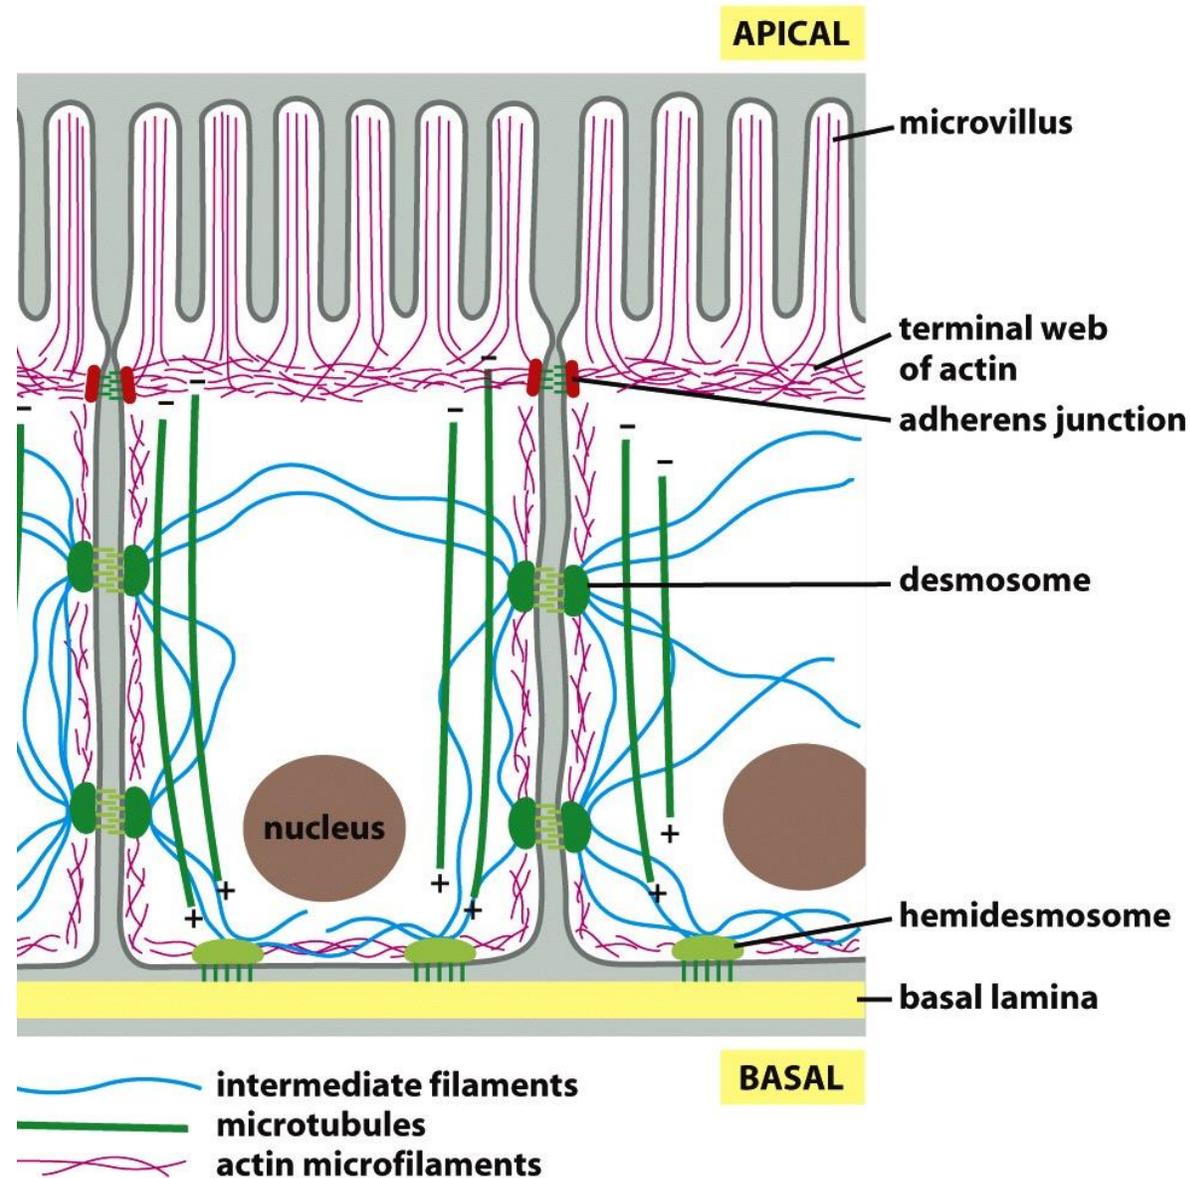

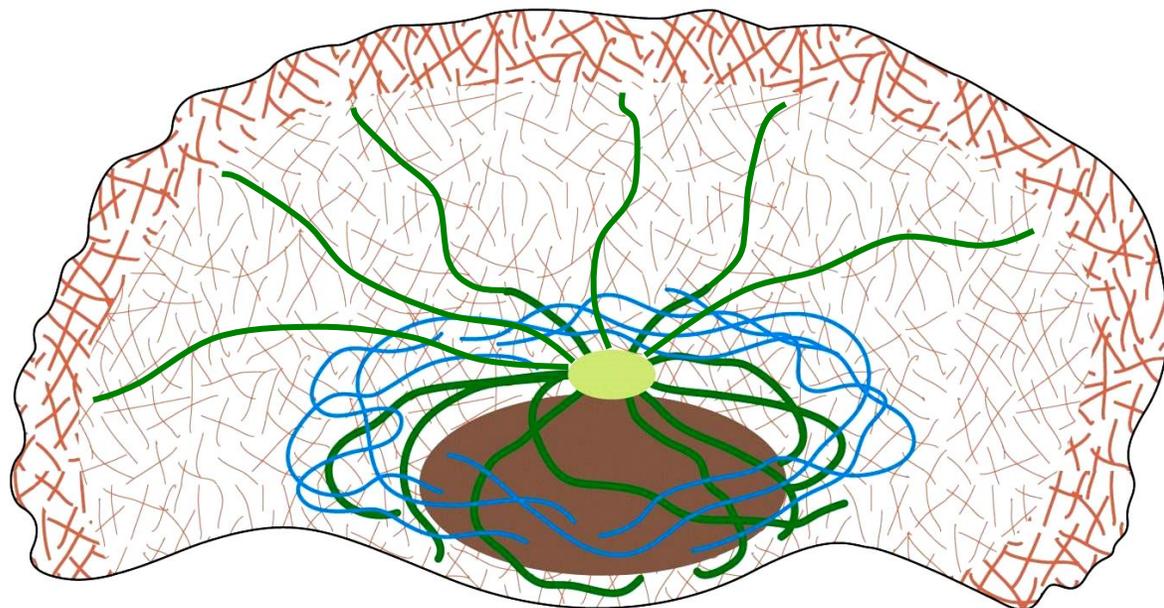

Elementos que componen el citoesqueleto

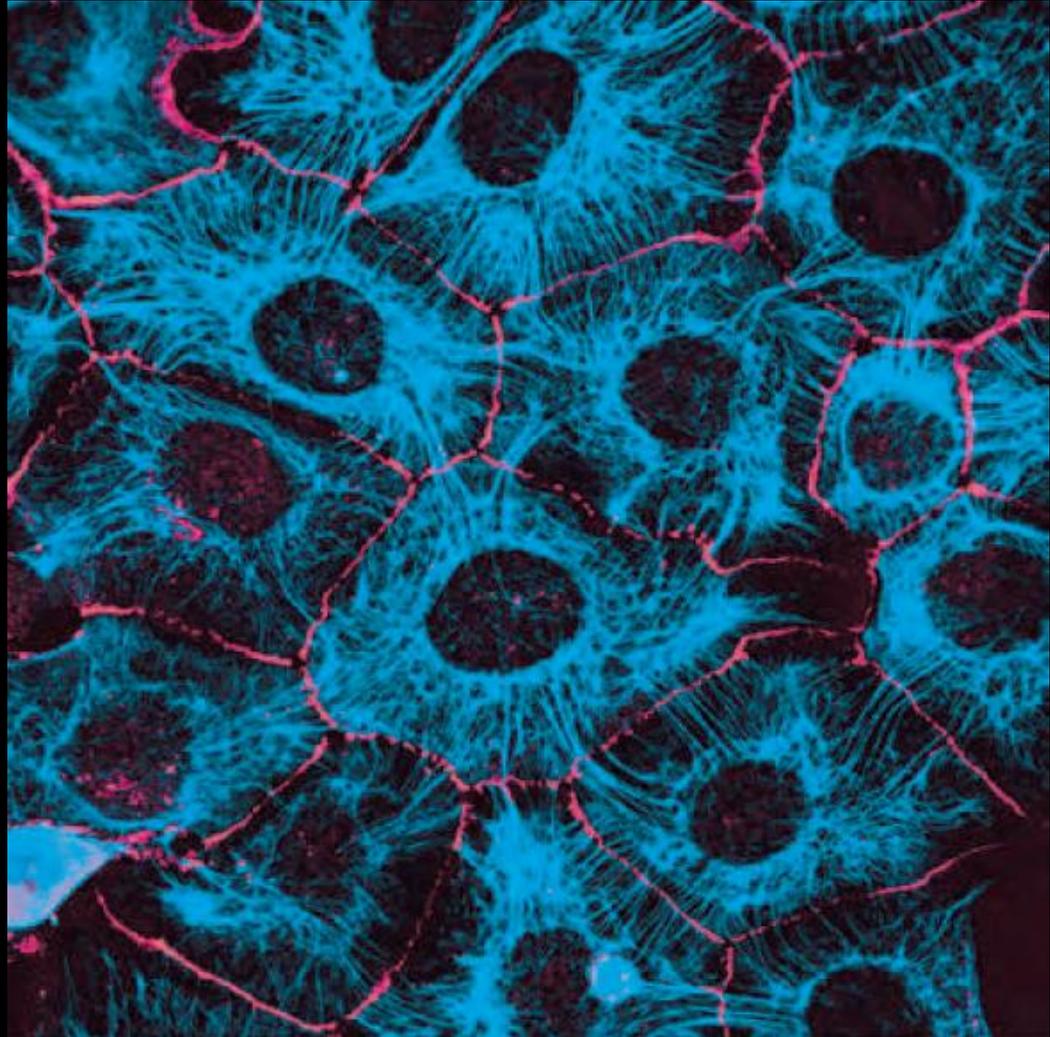

Filamentos de actina
(microfilamentos)

Microtúbulos

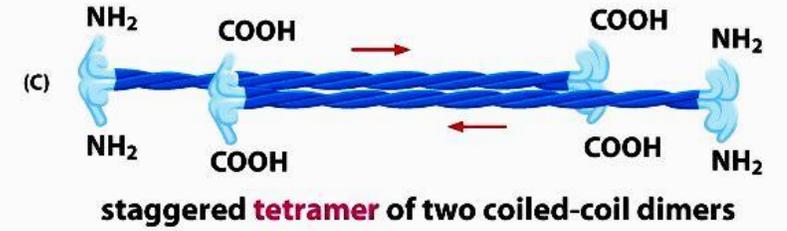

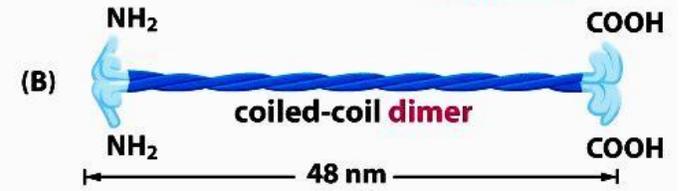

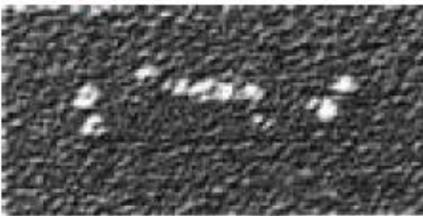

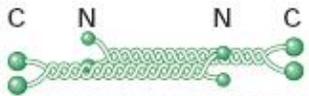

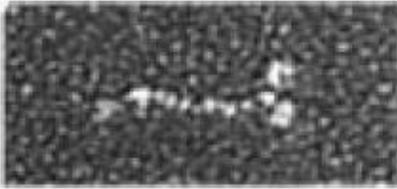

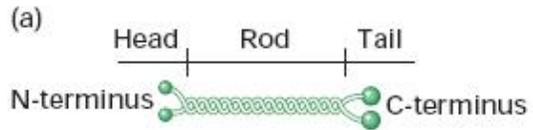

Filamentos intermedios

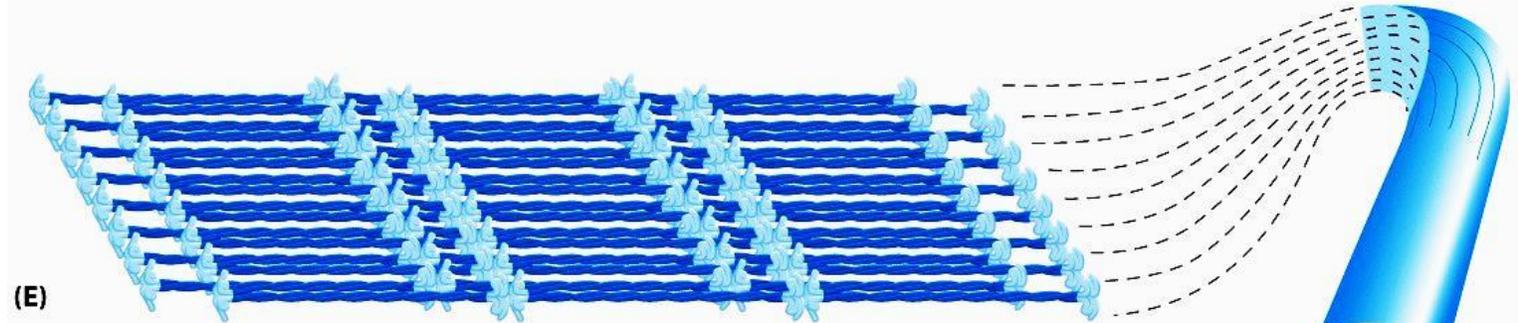

Filamentos intermedios:
Propiedades generales y funciones en las células

Filamentos Intermedios

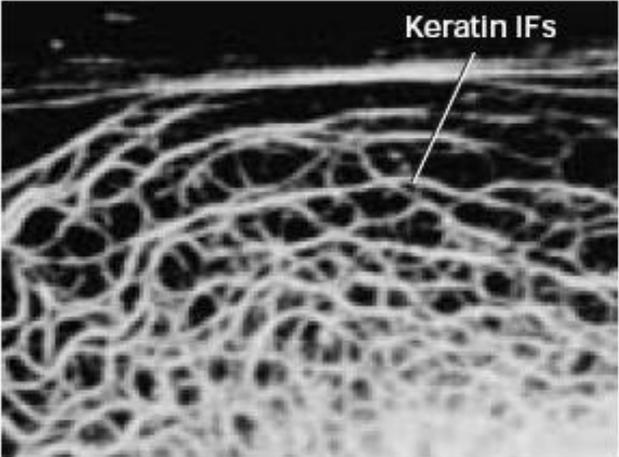

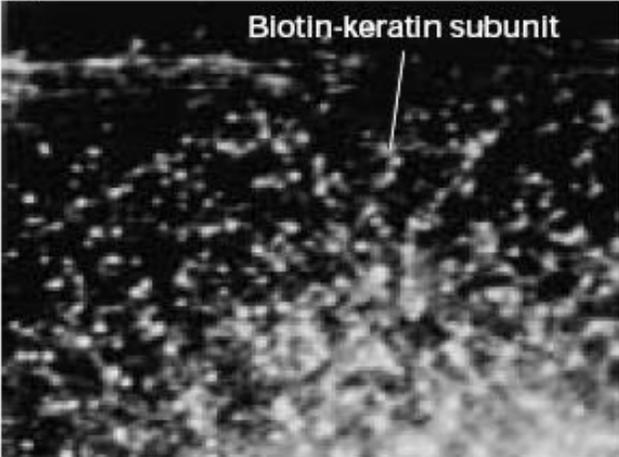

(D) two tetramers packed together

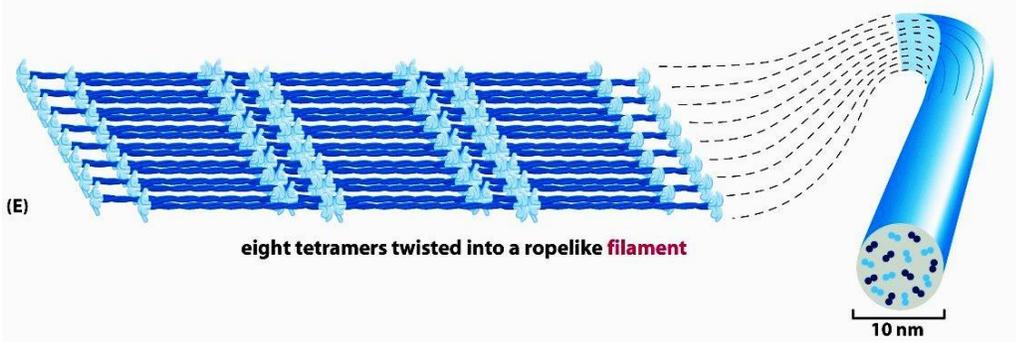

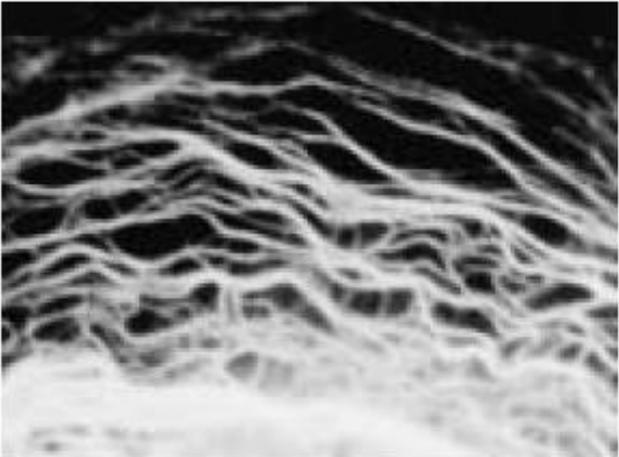

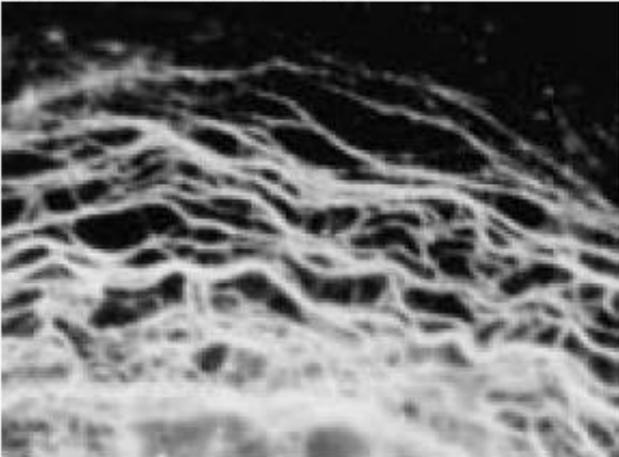

Filamentos intermedios: dinámica

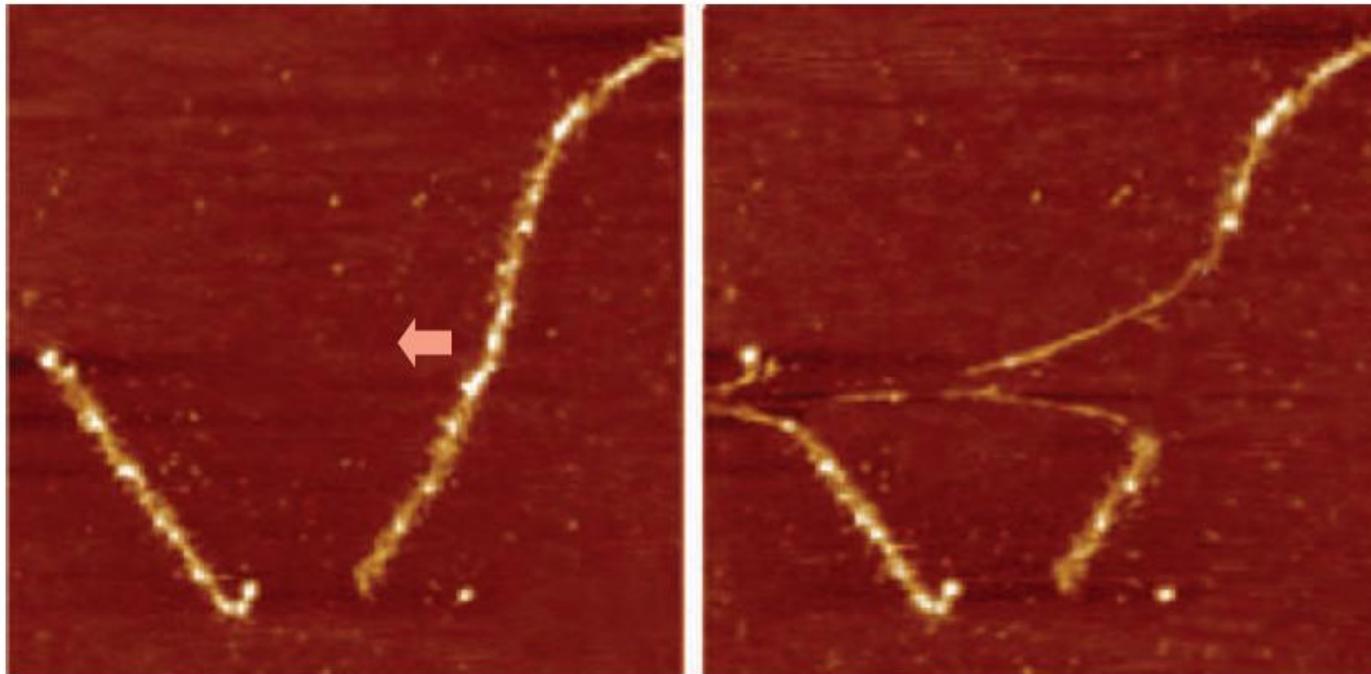

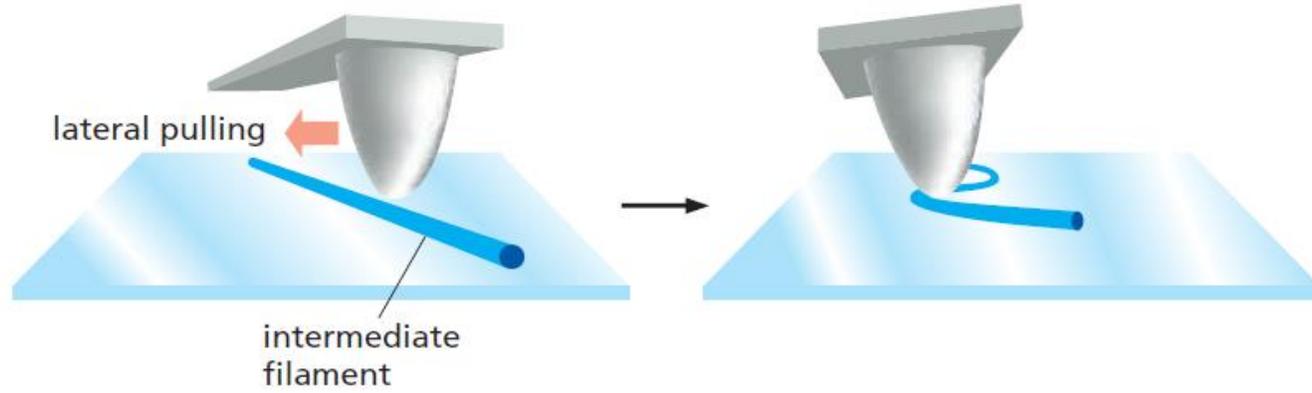

(a) 20 minutes after injection

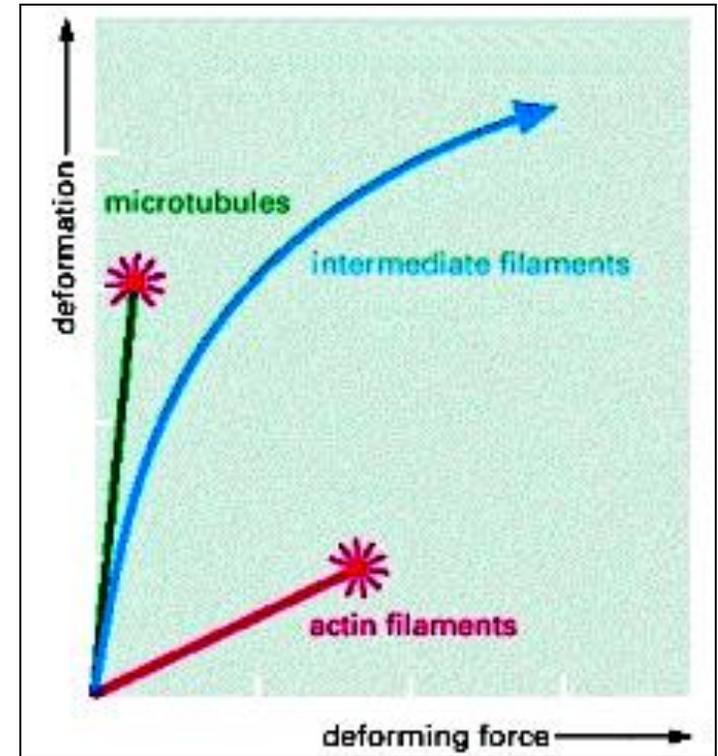

(b) 4 hours after injection

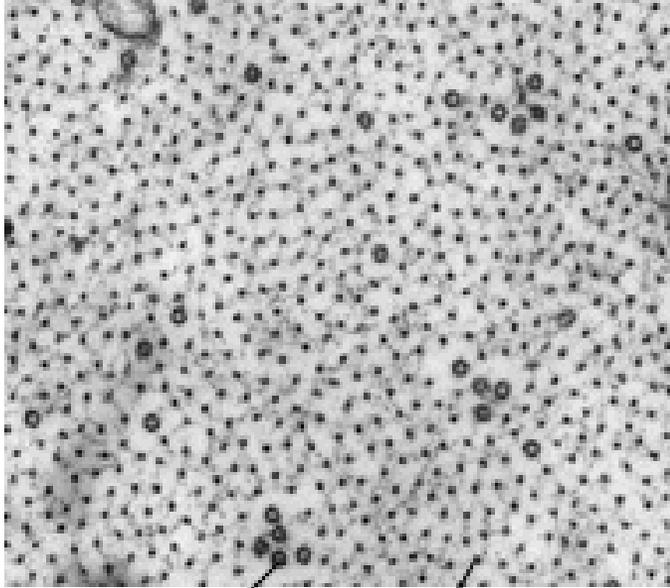

Filamentos intermedios: resistencia

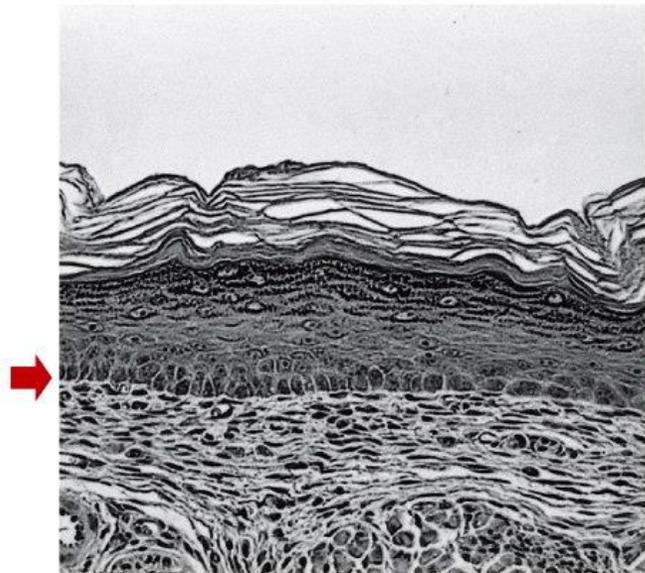

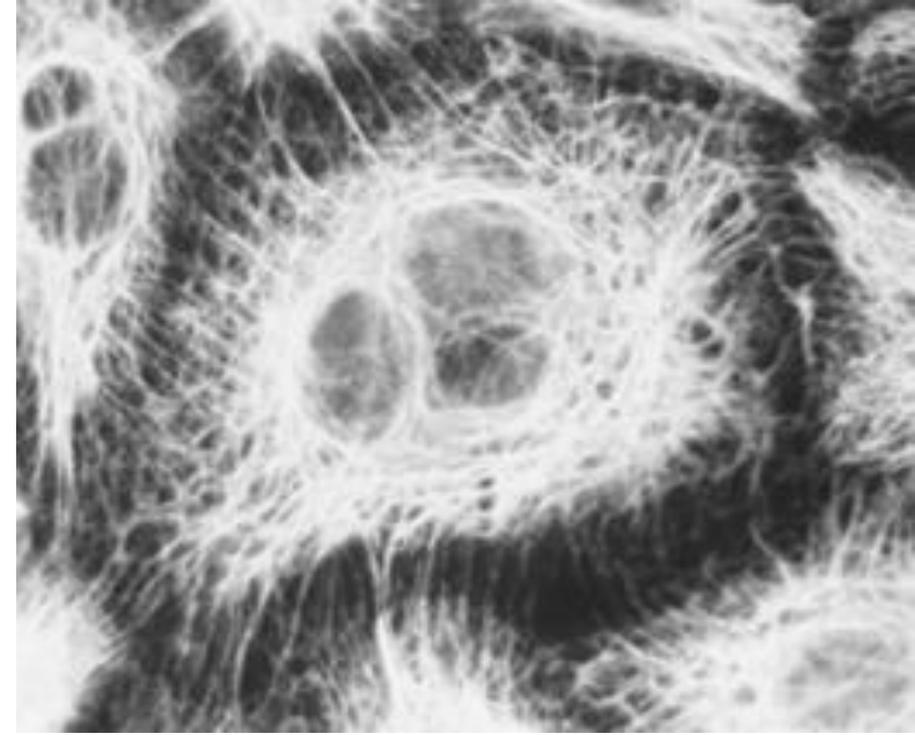

200 nm

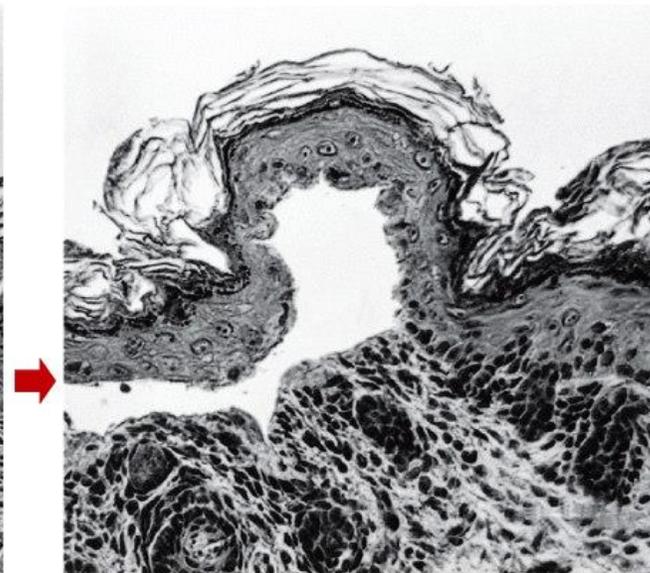

Filamentos Intermedios en las células

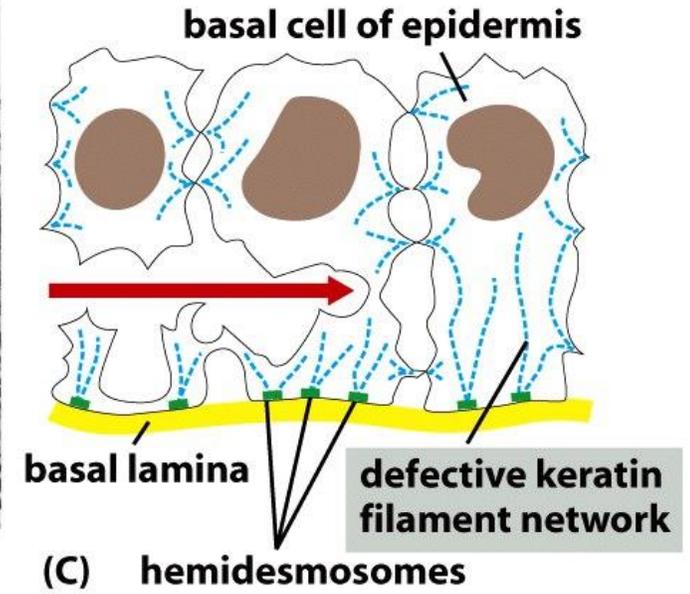

(C) microtubules
neurofilaments
250 nm

(A) 40 μm

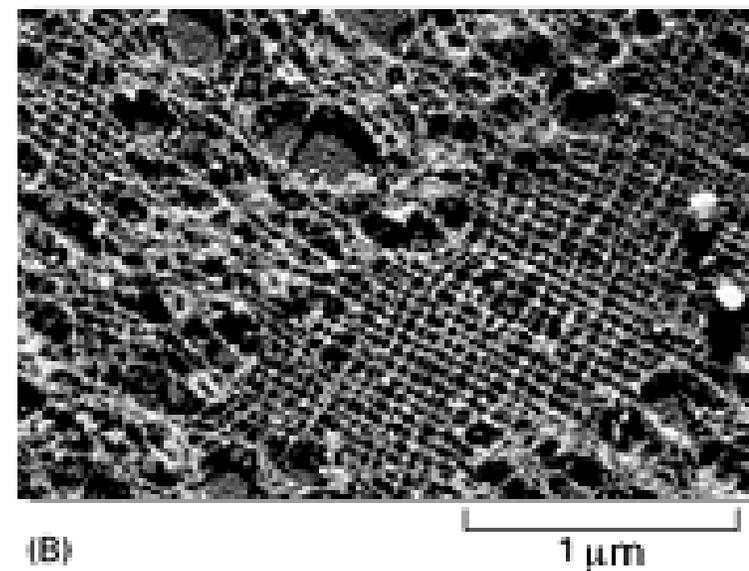

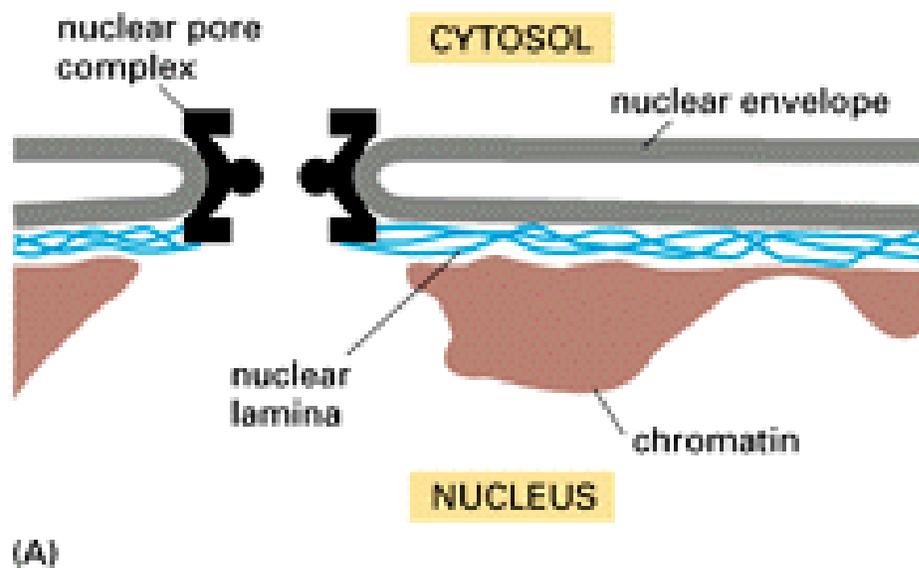

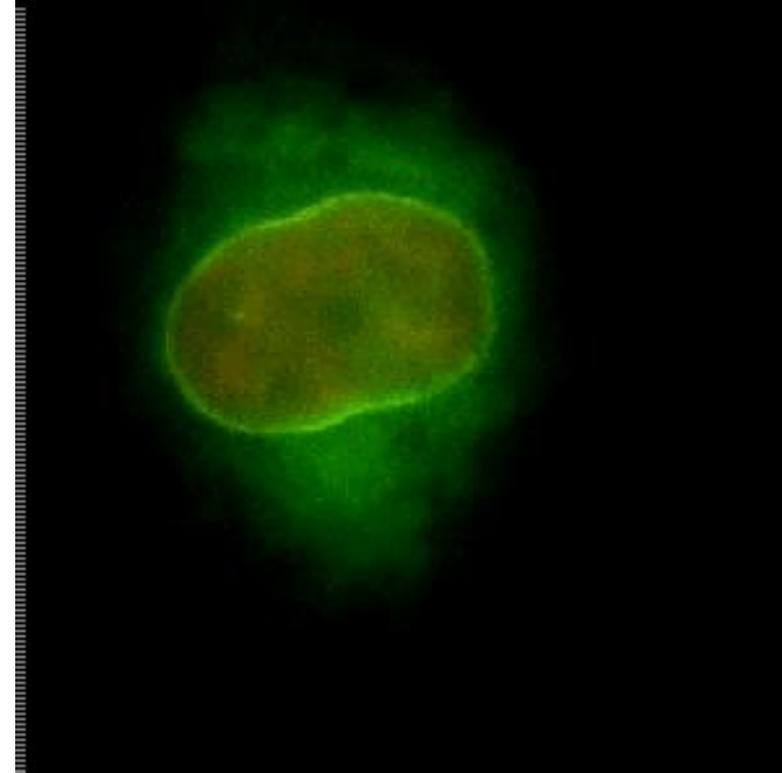

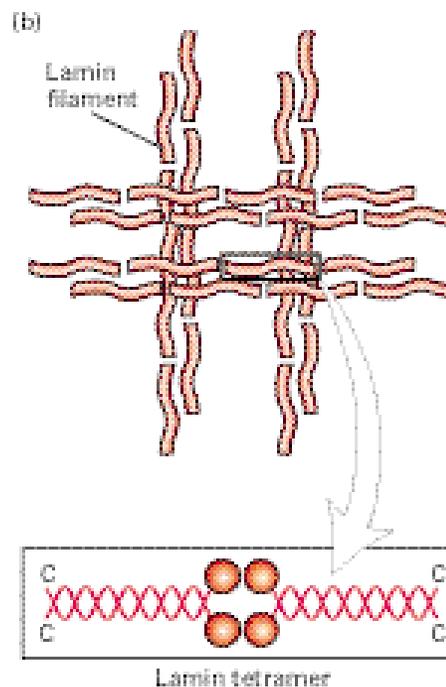

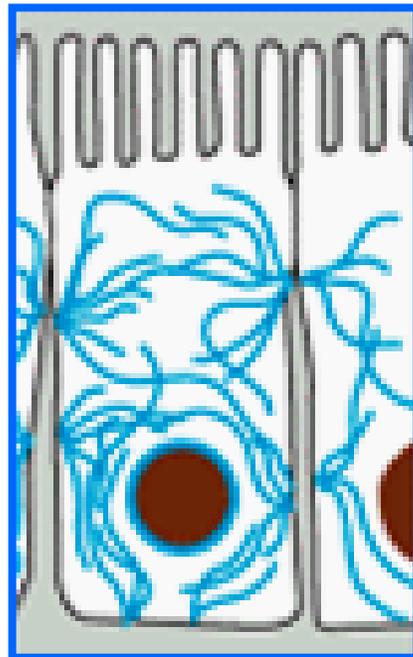

(B)

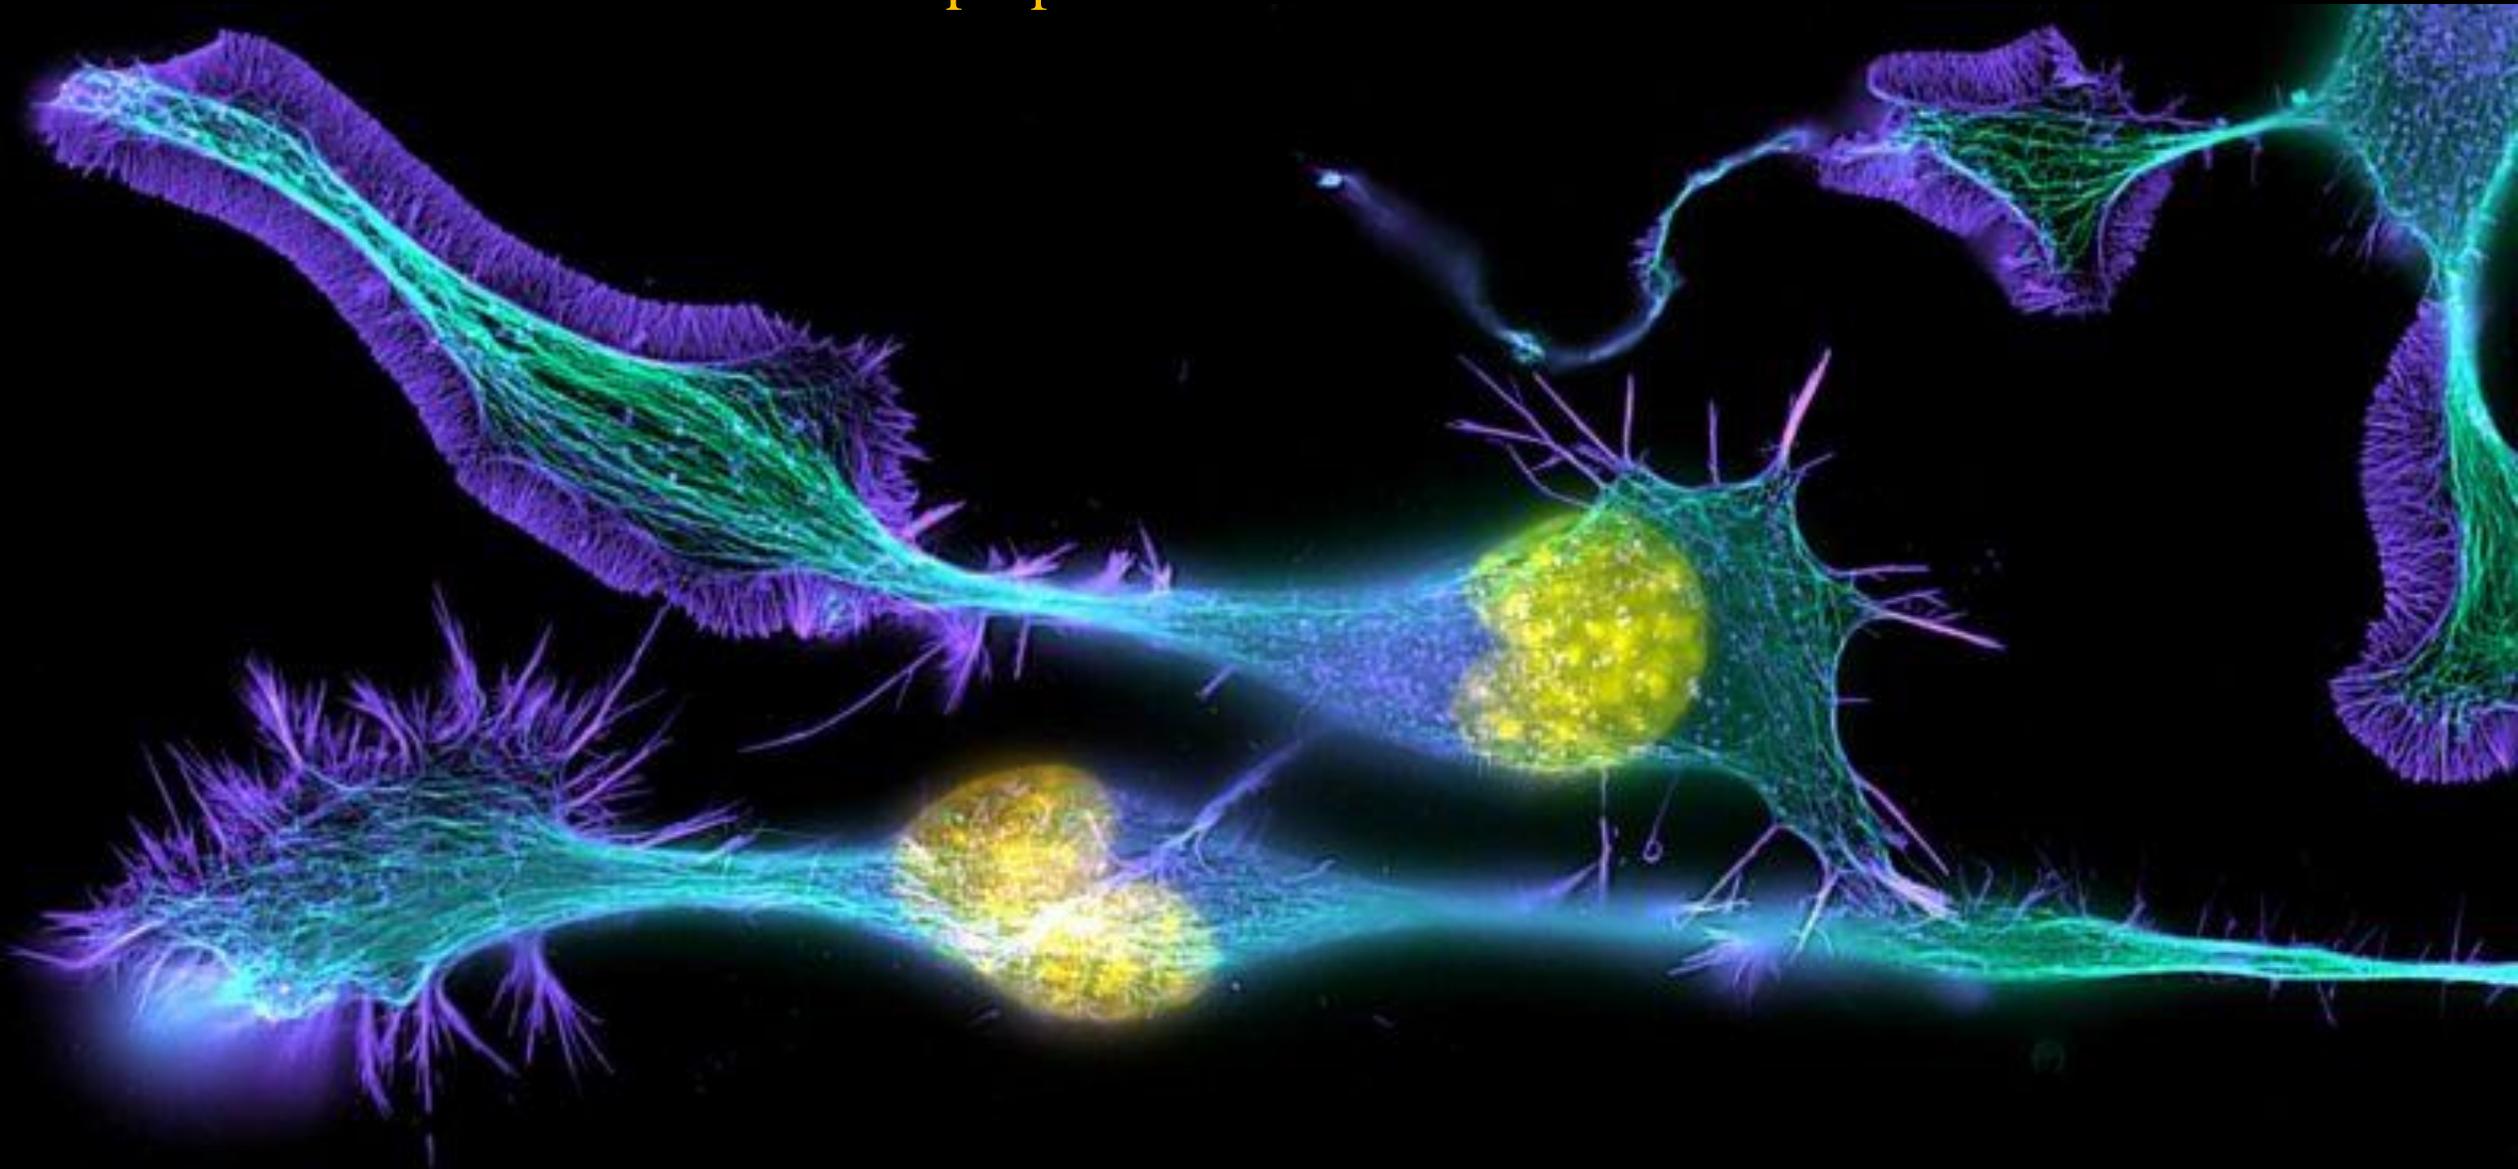

(C) hemidesmosomes

La lámina nuclear

Treadmilling (cinta transportadora)

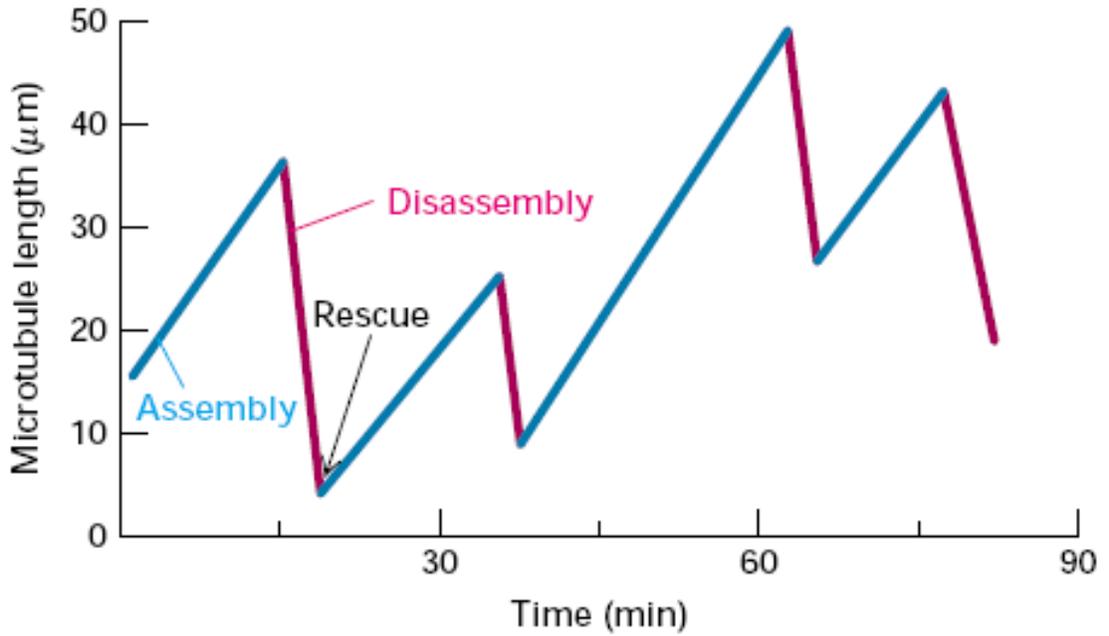

Polimerización y nucleótidos

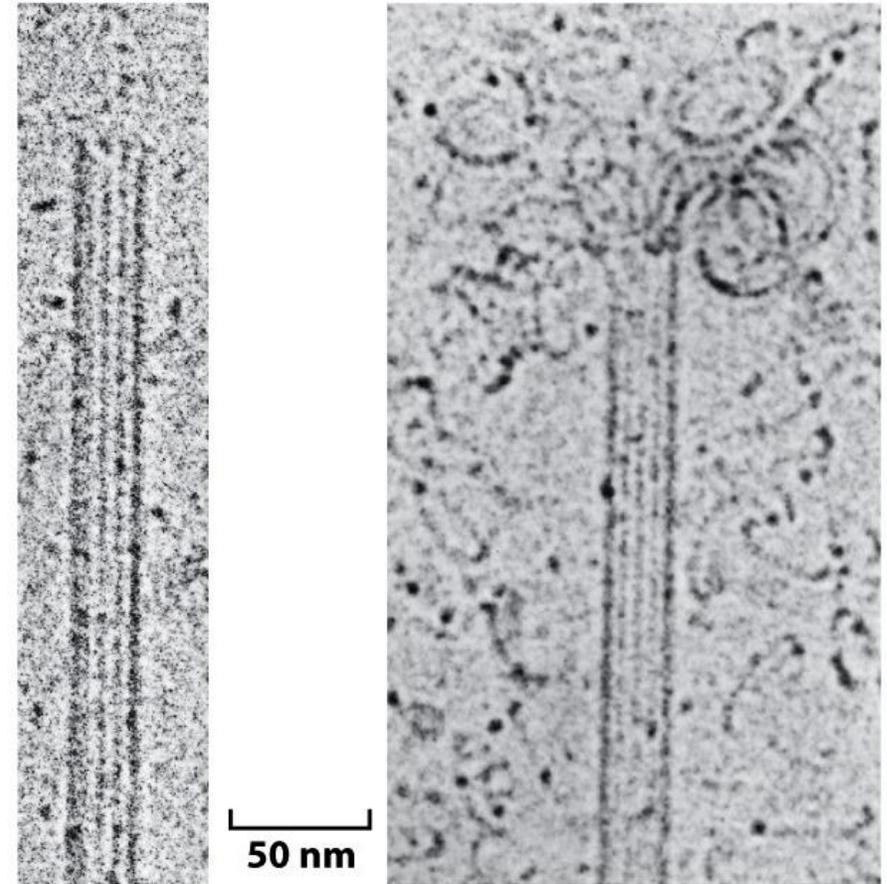

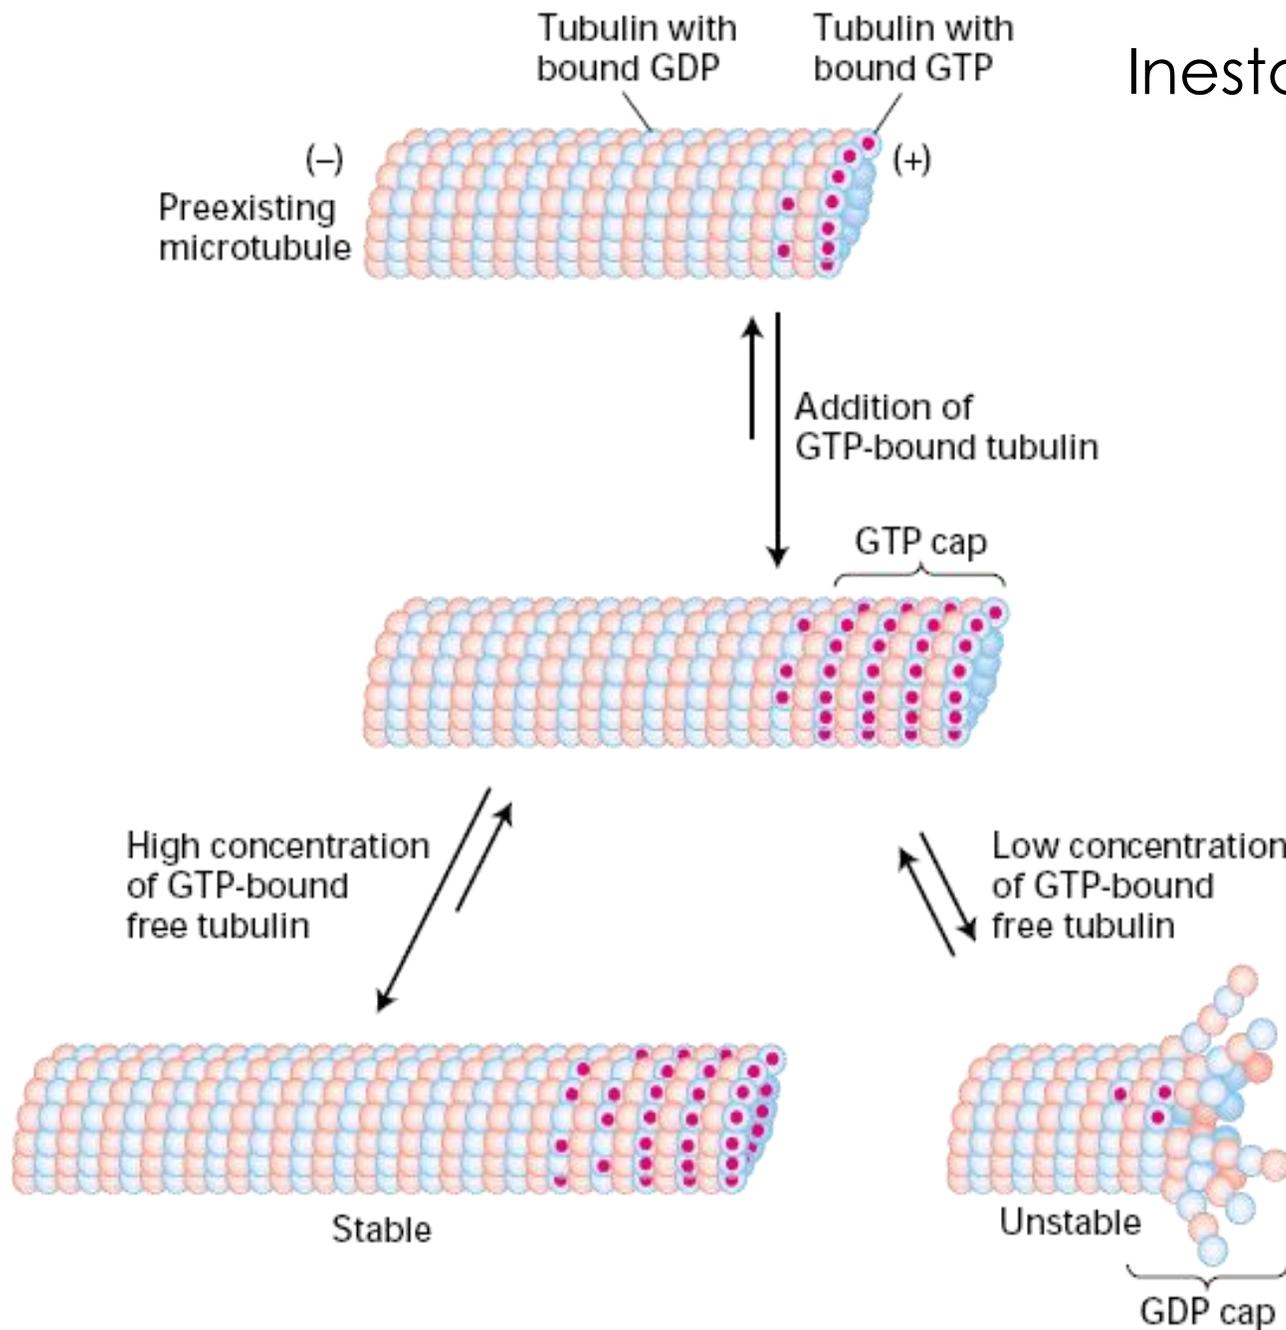

Crecimiento de los microtúbulos

<https://youtu.be/SorUcYfxsfg>

Inestabilidad dinámica de microtúbulos

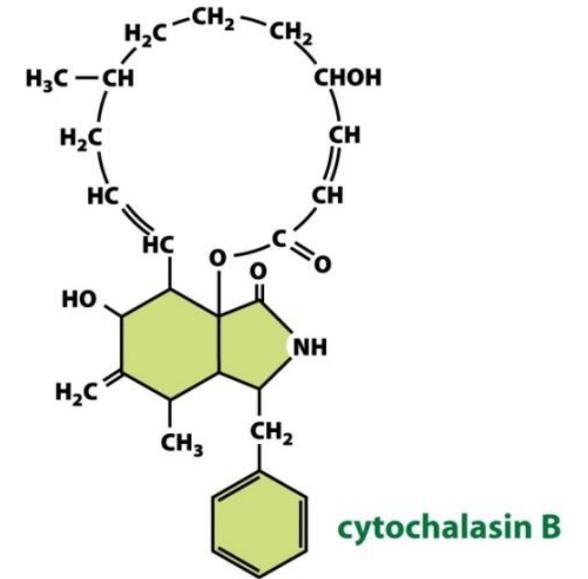

¡CATÁSTROFE!

Manipulación experimental de elementos del citoesqueleto

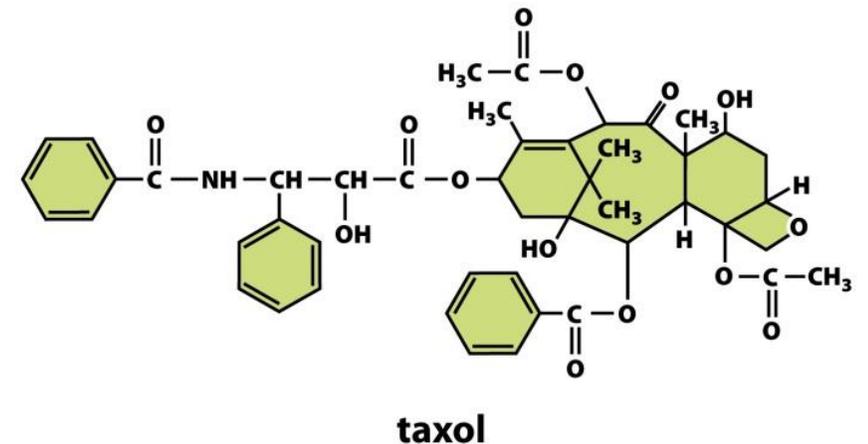

Drogas que afectan a la actina

Faloidina	Se une a filamentos y los estabiliza
Citocalasina	Cubre el extremo + y causa despolimerización
Swinholide	Corta filamentos
Latrunculina	Se une a subunidades e impide polimerización

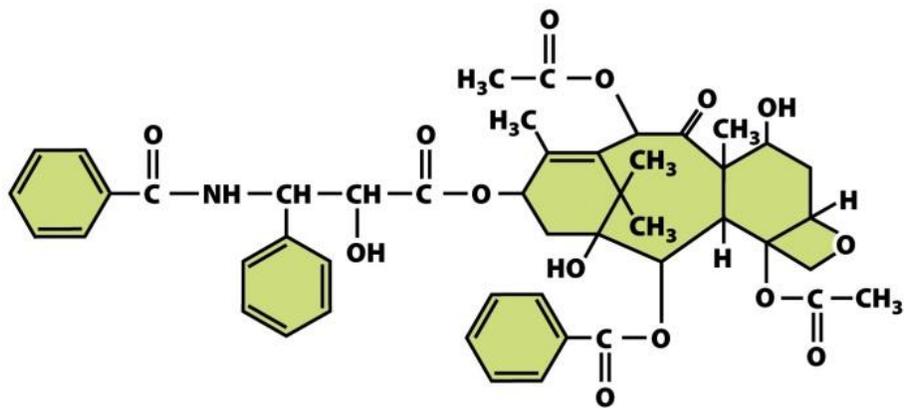

Drogas que afectan a los microtúbulos

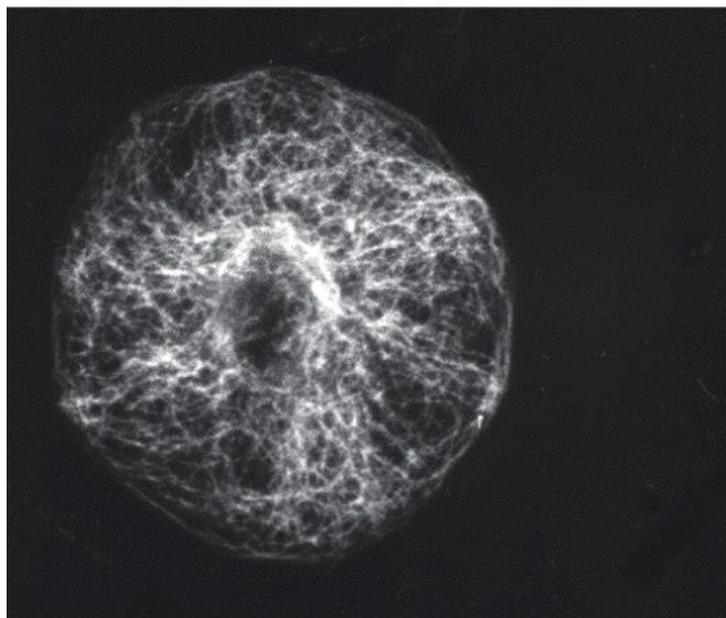

Taxol	Se une a filamentos y los estabiliza
Colchicina, colcemid	Se une a subunidades e impide polimerización
Vinblastina, vincristina	Se une a subunidades e impide polimerización
Nocodazole	Se une a subunidades e impide polimerización

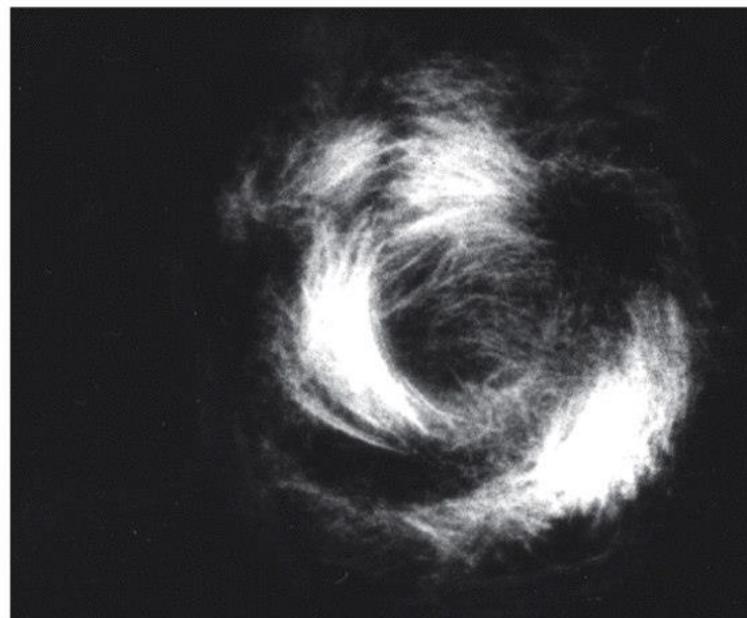

Manipulación experimental de elementos del citoesqueleto

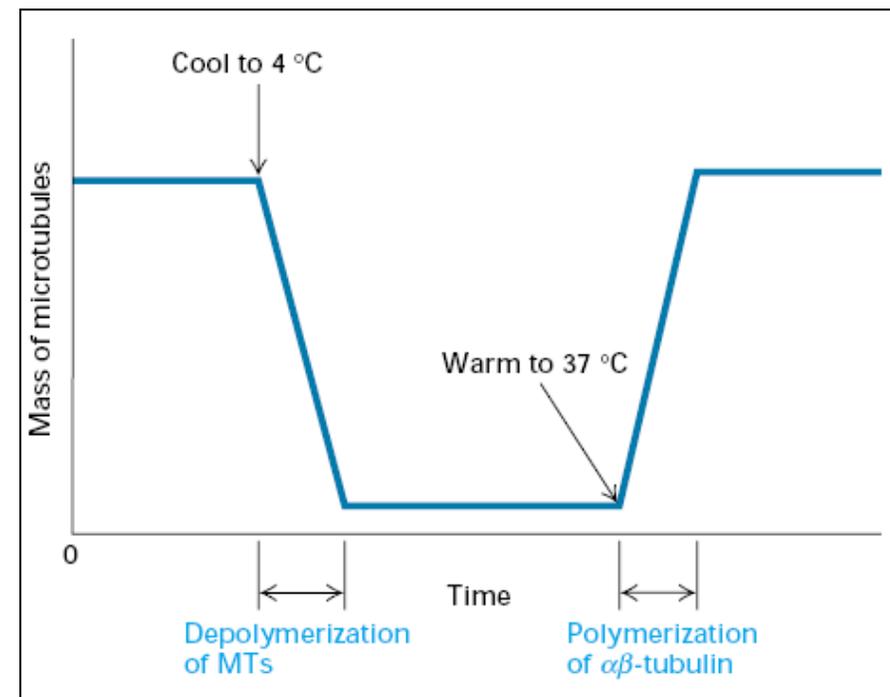

taxol
